

Spin and coupling determination of signals with missing energy at the LHC

Chien-Yi Chen
Carnegie Mellon University

In collaboration with Prof. Ayres Freitas,
JHEP 1102,002

Supersymmetry 2011

Outline

- Purpose and setup
- Spin determination
- Coupling determination
- Conclusions

Purpose

- Properties of new heavy particles beyond the standard model.
 - e.g.
 - Mass
 - Spin
 - Coupling
- Model independent approach.
- Consider all possible assignments of spins and SU(2) representations of new particles.

Purpose

- Properties of new heavy particles beyond the standard model.

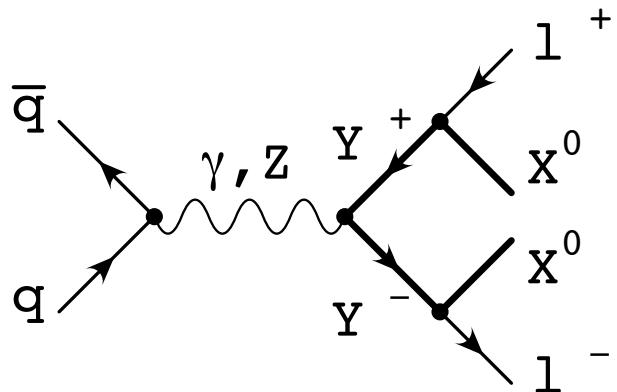

e.g.

- Mass
- Spin 
- Coupling 

- Model independent approach.
- Consider all possible assignments of spins and SU(2) representations of new particles.

Setup

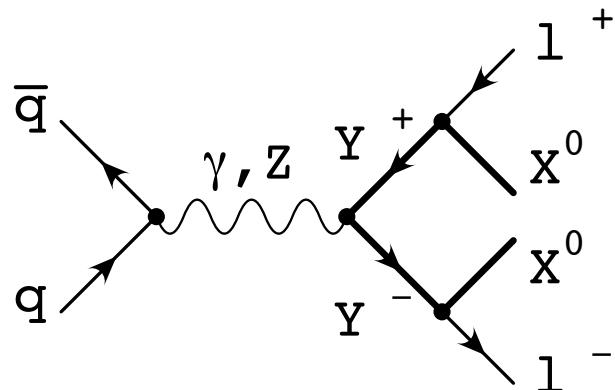

$$pp \rightarrow Y^+Y^- \rightarrow \ell^+\ell^-X^0\bar{X}^0, \quad (\ell = e, \mu).$$

- Y : Charged massive particles.
- X : Missing energy signal; neutral massive particle. It can be a dark matter candidate.

Setup

$$pp \rightarrow Y^+Y^- \rightarrow \ell^+\ell^- X^0\bar{X}^0, \quad (\ell = e, \mu).$$

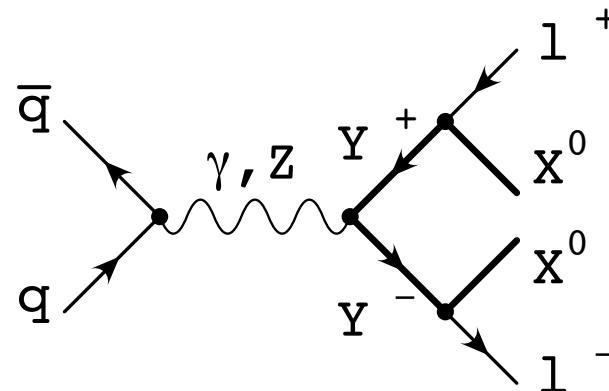

- Y : Charged massive particles.
- X : Missing energy signal; neutral massive particle. It can be a dark matter candidate.
- Assume a discrete symmetry to ensure X is pair produced:

e.g.

- R-parity in supersymmetry
- KK parity in universal extra dimensions

Spins of the X and Y

- Angular momentum conservation

Y	0	$1/2$	1
X	$1/2$	0 or 1	$1/2$
L	$1/2$	$1/2$	$1/2$

SU(2) representations of X and Y

- Singlet: 1 e.g. $e_R(x)$
- Doublet: 2 e.g. $L(x) = \begin{pmatrix} \nu_L(x) \\ E_L(x) \end{pmatrix}$
- Triplet (adjoint rep.): 3, $[T_a, T_b] = i f_{abc} T_c$
 $[T_a]_{bc} = -i f_{abc}$
e.g. W^\pm W^0

[Doublet] 1x2	[Doublet] 2x1	[Singlet] 1x1
[Singlet] 1x1	[Singlet] 1x1	[Singlet] 1x1
[Doublet] 1x2	[Triplet] 2x2	[Doublet] 2x1

	Y $s, I_{\text{SU}(2)}$	X $s, I_{\text{SU}(2)}$	ℓ $I_{\text{SU}(2)}$	ZYY coupling	$XY\ell$ coupling

Example: in supersymmetry

Combination I I

	Y $s, I_{\text{SU}(2)}$	X $s, I_{\text{SU}(2)}$	ℓ $I_{\text{SU}(2)}$	ZYY coupling	$XY\ell$ coupling	sample model and decay $Y^- \rightarrow \ell^- X$
11	1, 3	$\frac{1}{2}, 2$	2	$S[Z, Y, Y^*]$	$XY^{*\frac{1-\gamma_5}{2}}\ell$	UED $W_{\mu,(1)}^- \rightarrow \ell^- \nu_{(1)}$

$$S[Z, Y, Y^*] \equiv Z_\mu Y_\nu^* \overleftrightarrow{\partial}^\mu Y^\nu + Y_\mu Z_\nu \overleftrightarrow{\partial}^\mu Y^{*\nu} + Y_\mu^* Y_\nu \overleftrightarrow{\partial}^\mu Z^\nu$$

- s-channel contribution alone grows monotonically with the center-of-mass energy. t-channel diagram must be considered due to unitarity.
- s- and t-channel interfere negatively.
- In the t-channel, heavy \hat{Q} for the masses 500GeV and 1000GeV are considered in the simulation.
- If \hat{Q} is light, it has larger cross section and might be observed directly.

Spin determination

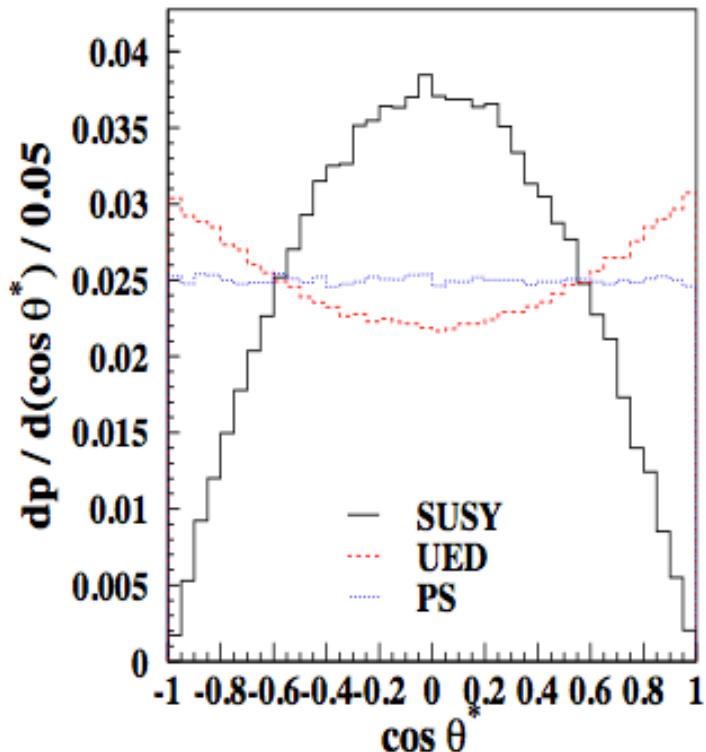

Production angular distribution:

SUSY

scalar Y (spin 0): $\frac{d\sigma}{d \cos \theta^*} \propto 1 - \cos^2 \theta^*$,

UED

fermion Y (spin $\frac{1}{2}$): $\frac{d\sigma}{d \cos \theta^*} \propto 2 + \beta_Y^2 (\cos^2 \theta^* - 1)$,

- θ^* stands for the production angle.
- PS stands for phase space.

A. Barr, JHEP 0602, 042(2006)

Variables for spin determination

Effective mass

$$M_{\text{eff}} = p_{T,\ell^+} + p_{T,\ell^-} + \cancel{p}_T,$$

Azimuthal angle difference
of the two leptons

$$\Delta\phi_{\ell\ell} = |(\phi_{\ell^+} - \phi_{\ell^-}) \bmod 2\pi|.$$

Barr's variable

$$\cos\theta_{\ell\ell}^* = \tanh \frac{|\eta_{\ell^+} - \eta_{\ell^-}|}{2} = \tanh \frac{\Delta\eta_{\ell\ell}}{2}$$

A. Barr, JHEP 0602, 042(2006)

- η_{ℓ^-} : The pseudorapidity of the lepton

Pseudorapidity: $\eta = \frac{1}{2} \log \left[\frac{p + p_z}{p - p_z} \right] = -\log[\tan(\theta/2)]$

- $\theta_{\ell\ell}^*$ is strongly correlated to the production angle.
- They are all Lorentz invariant along the boost direction.

Numerical results for spin determination

	Y $s, I_{\text{SU}(2)}$	X $s, I_{\text{SU}(2)}$	ℓ $I_{\text{SU}(2)}$	ZYY coupling	$XY\ell$ coupling
3	0, 3	$\frac{1}{2}$, 2	2	$Z^\mu Y^* \overleftrightarrow{\partial}_\mu Y$	$\bar{X} \frac{1-\gamma_5}{2} \ell Y^*$
10	$\frac{1}{2}$, 3	0, 2	2	$\bar{Y} Z Y$	$\bar{Y} \frac{1-\gamma_5}{2} \ell X$
11	1, 3	$\frac{1}{2}$, 2	2	$S[Z, Y, Y^*]$	$\bar{X} Y^* \frac{1-\gamma_5}{2} \ell$

$\sqrt{\chi^2}$ value for a 5-bin χ^2 – test , 5000 parton-level events. $m_Y = 300$ GeV and $m_X = 100$ GeV.

Variable	(model A, model B)				
	(3,10)	(3,11) [$M_Q=1$ TeV]	(3,11) [$M_Q=0.5$ TeV]	(10,11) [$M_Q=1$ TeV]	(10,11) [$M_Q=0.5$ TeV]
$\tanh(\Delta\eta_{\ell\ell}/2)$	19.0	18.6	26.0	2.4	8.0
M_{eff}	37.5	3.9	25.1	30.7	9.5
$\Delta\phi_{\ell\ell}$	16.3	21.4	10.7	41.1	29.0
All combined	37.5	21.4	26.0	41.1	29.0

Coupling determination

- Definition of the charge asymmetry:

$$A_{\ell^+\ell^-} = \frac{N(E_{\ell^-} > E_{\ell^+}) - N(E_{\ell^+} > E_{\ell^-})}{N(E_{\ell^-} > E_{\ell^+}) + N(E_{\ell^+} > E_{\ell^-})}$$

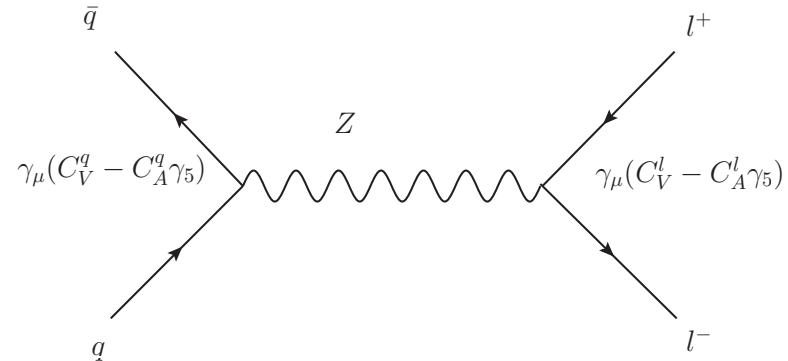

$N(E_{\ell^-} > E_{\ell^+})$ denotes the number of events for which ℓ^- has a larger energy than ℓ^+ .

- It is well correlated with the forward and backward asymmetry at the LHC.

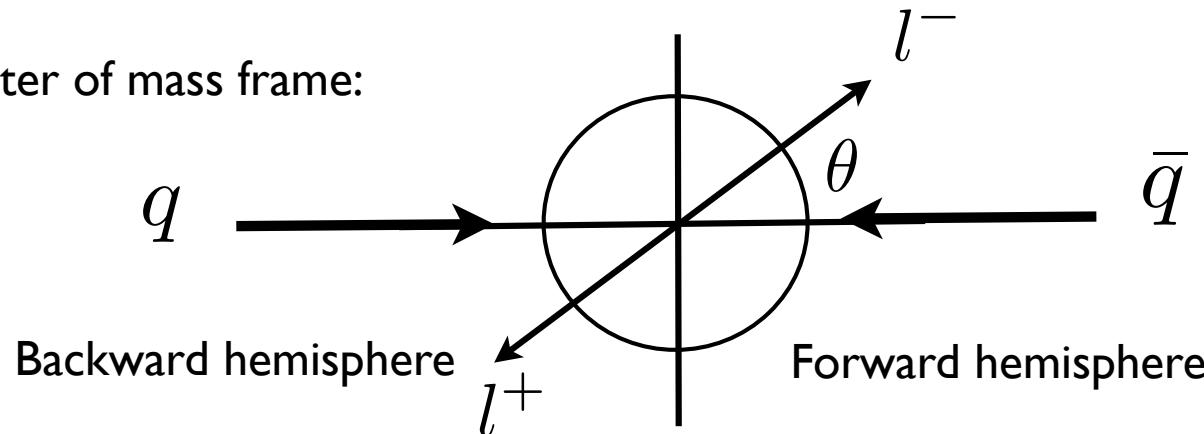

Coupling determination

Review of the forward-backward asymmetry:

e.g. $q\bar{q} \rightarrow l^+l^-$

In the center of mass frame:

Forward-backward asymmetry

$$\frac{d\sigma}{d\cos\theta} = N_c[(1 + \cos^2\theta)F_0(s) + 2\cos\theta F_1(s)] \quad , \text{ where } N_c \text{ is the color factor.}$$

$$\begin{aligned} F_0(s) &= \frac{\pi\alpha^2}{2s}(q_q^2 q_l^2 + 2Re\chi(s)q_q q_l C_V^q C_V^l + |\chi(s)|^2((C_V^q)^2 + (C_A^q)^2)((C_V^l)^2 + (C_A^l)^2)) \\ F_1(s) &= \frac{\pi\alpha^2}{2s}(2Re\chi(s)q_q q_l C_A^q C_A^l + |\chi(s)|^2 2C_V^q C_V^l 2C_A^q C_A^l), \end{aligned}$$

with

$$\chi(s) = \frac{s}{s - M_Z^2 + is\Gamma_Z/M_Z}$$

- Definition of forward-backward asymmetry:

$$A_{FB} = \frac{N_F - N_B}{N_F + N_B}$$

$$F = \int_0^1 \frac{d\sigma}{d\cos\theta} d\cos\theta, \quad B = \int_{-1}^0 \frac{d\sigma}{d\cos\theta} d\cos\theta$$

Difficult to define forward-backward asymmetry at the LHC

- Hard to define the forward direction
- Center-of-mass energy of quark and anti-quark is unknown
- The incoming quark are more energetic than incoming anti-quark because the valence quarks are more energetic than sea quarks.

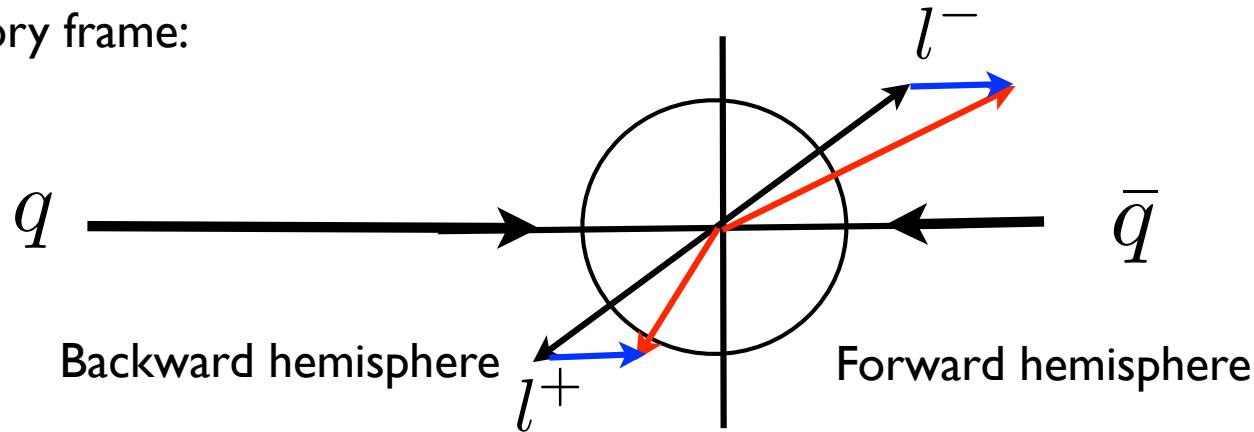

Charge asymmetry

Center of mass frame:

$$E_{l^-} = \sqrt{m^2 + p_x^2 + p_y^2 + p_z^2} = E_{l^+}$$

$$A_{FB} = \frac{N_F - N_B}{N_F + N_B}$$

Laboratory frame:

- Define charge asymmetry:

$$E_{l^-} = \sqrt{m^2 + p_x^2 + p_y^2 + (p_z + \cancel{p'_z})^2}$$

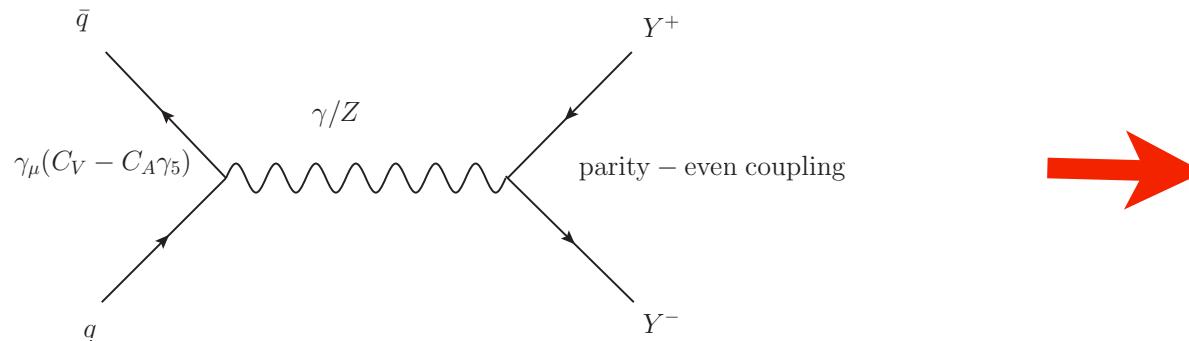

$$E_{l^+} = \sqrt{m^2 + (-p_x)^2 + (-p_y)^2 + (-p_z + \cancel{p'_z})^2}$$

$$A_{\ell^+\ell^-} = \frac{N(E_{\ell^-} > E_{\ell^+}) - N(E_{\ell^+} > E_{\ell^-})}{N(E_{\ell^-} > E_{\ell^+}) + N(E_{\ell^+} > E_{\ell^-})}$$

$N(E_{\ell^-} > E_{\ell^+})$ denotes the number of events for which ℓ^- has a larger energy than ℓ^+ .

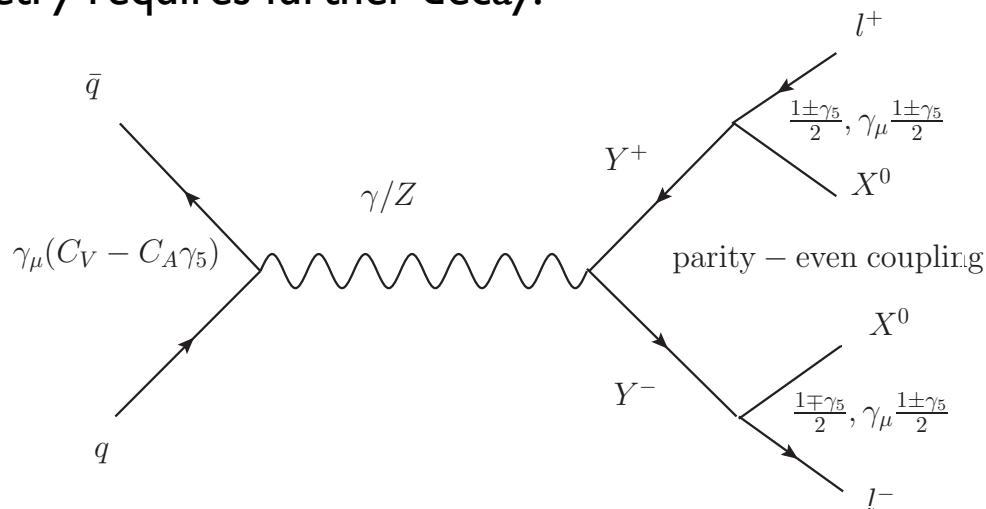

Coupling determination

- In the production part : Charge asymmetry is zero.

No charge
asymmetry

- Charge asymmetry requires further decay:

- However, charge asymmetry does not work for scalar Y cases due to the absence of spin correlations between the production and decay parts of the process.
- For fermion Y cases, the V-A structure still exists.

	Y $s, I_{\text{SU}(2)}$	X $s, I_{\text{SU}(2)}$	ℓ $I_{\text{SU}(2)}$	ZYY coupling	$XY\ell$ coupling
1	0, 1	$\frac{1}{2}, 1$	1	$Z^\mu Y^* \overleftrightarrow{\partial}_\mu Y$	$\bar{X} \frac{1+\gamma_5}{2} \ell Y^*$
2	0, 2	$\frac{1}{2}, 1$	2	$Z^\mu Y^* \overleftrightarrow{\partial}_\mu Y$	$\bar{X} \frac{1-\gamma_5}{2} \ell Y^*$
3	0, 3	$\frac{1}{2}, 2$	2	$Z^\mu Y^* \overleftrightarrow{\partial}_\mu Y$	$\bar{X} \frac{1-\gamma_5}{2} \ell Y^*$
4	$\frac{1}{2}, 1$	0, 1	1	$\bar{Y} \not{Z} Y$	$\bar{Y} \frac{1+\gamma_5}{2} \ell X$
5	$\frac{1}{2}, 1$	0, 2	2	$\bar{Y} \not{Z} Y$	$\bar{Y} \frac{1-\gamma_5}{2} \ell X$
6	$\frac{1}{2}, 1$	1, 1	1	$\bar{Y} \not{Z} Y$	$\bar{Y} \not{X} \frac{1+\gamma_5}{2} \ell$
7	$\frac{1}{2}, 2$	0, 1	2	$\bar{Y} \not{Z} Y$	$\bar{Y} \frac{1-\gamma_5}{2} \ell X$
8	$\frac{1}{2}, 2$	0, 2	1	$\bar{Y} \not{Z} Y$	$\bar{Y} \frac{1+\gamma_5}{2} \ell X$
9	$\frac{1}{2}, 2$	1, 1	2	$\bar{Y} \not{Z} Y$	$\bar{Y} \not{X} \frac{1-\gamma_5}{2} \ell$
10	$\frac{1}{2}, 3$	0, 2	2	$\bar{Y} \not{Z} Y$	$\bar{Y} \frac{1-\gamma_5}{2} \ell X$
11	1, 3	$\frac{1}{2}, 2$	2	$S[Z, Y, Y^*]$	$\bar{X} Y^* \frac{1-\gamma_5}{2} \ell$

Indistinguishable by using charge asymmetry.

Most of them are distinguishable by using charge asymmetry!

$$\overleftrightarrow{A} \partial_\mu B \equiv A(\partial_\mu B) - (\partial_\mu A)B,$$

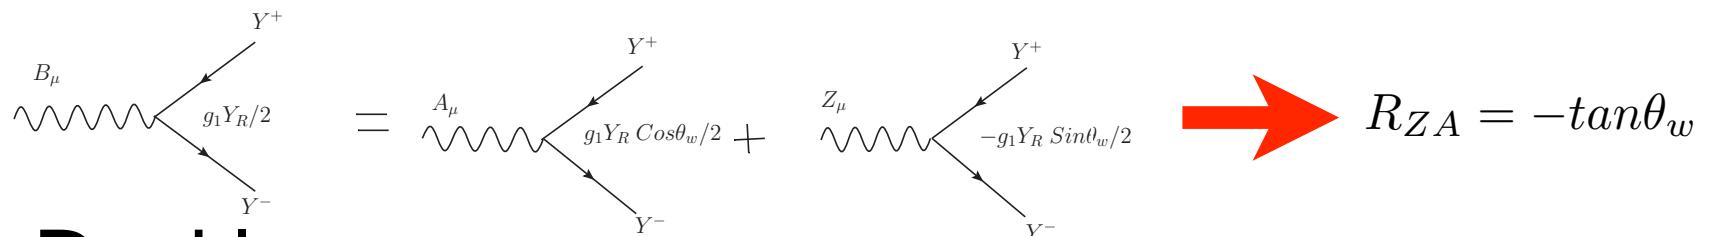

$$S[Z, Y, Y^*] \equiv Z_\mu Y_\nu^* \overleftrightarrow{\partial}^\mu Y^\nu + Y_\mu Z_\nu \overleftrightarrow{\partial}^\mu Y^{*\nu} + Y_\mu^* Y_\nu \overleftrightarrow{\partial}^\mu Z^\nu$$

R_{ZA} : Ratio of ZYY to AYY coupling

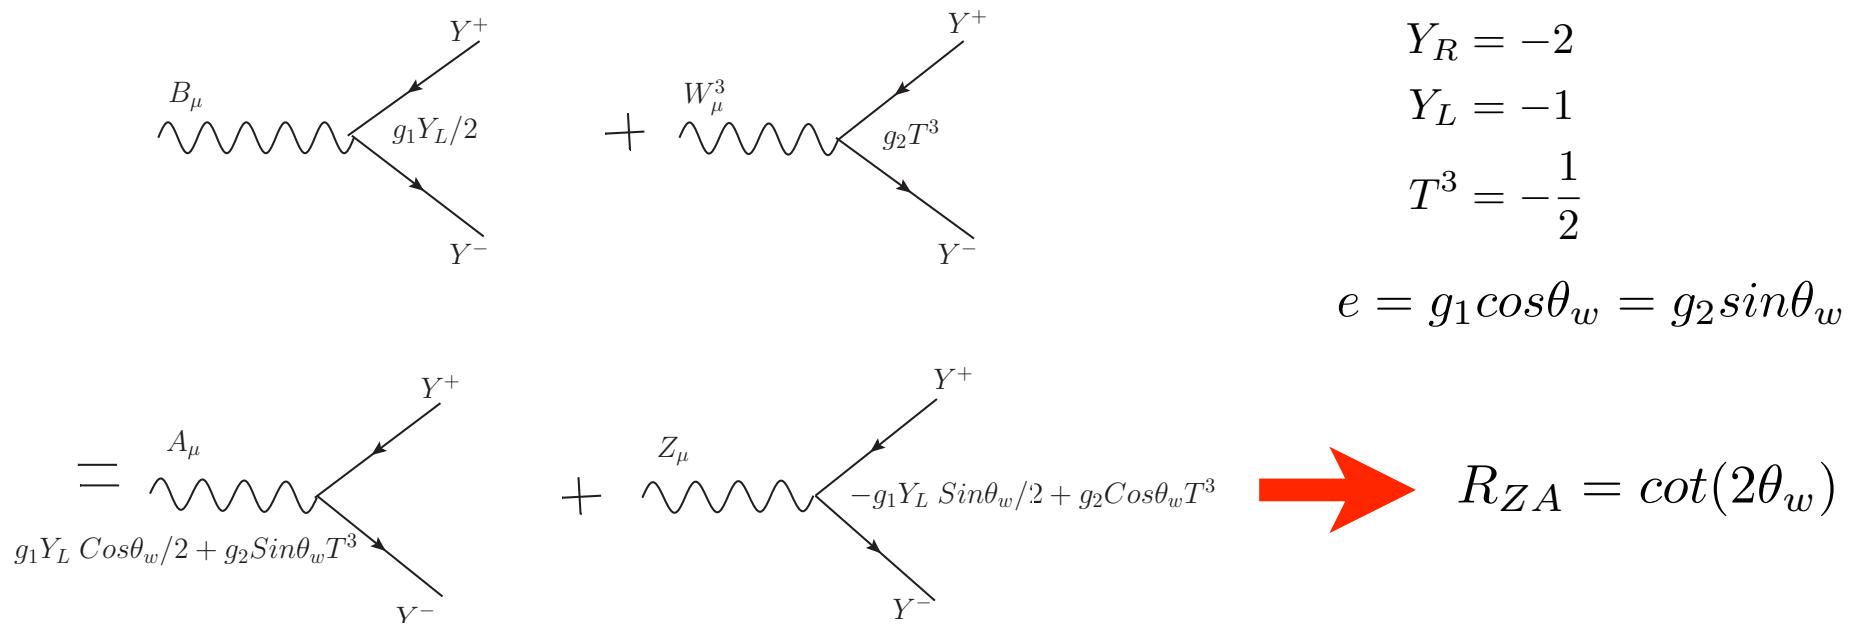

$$B_\mu = \cos\theta_w A_\mu - \sin\theta_w Z_\mu$$

$$W_\mu^3 = \sin\theta_w A_\mu + \cos\theta_w Z_\mu$$

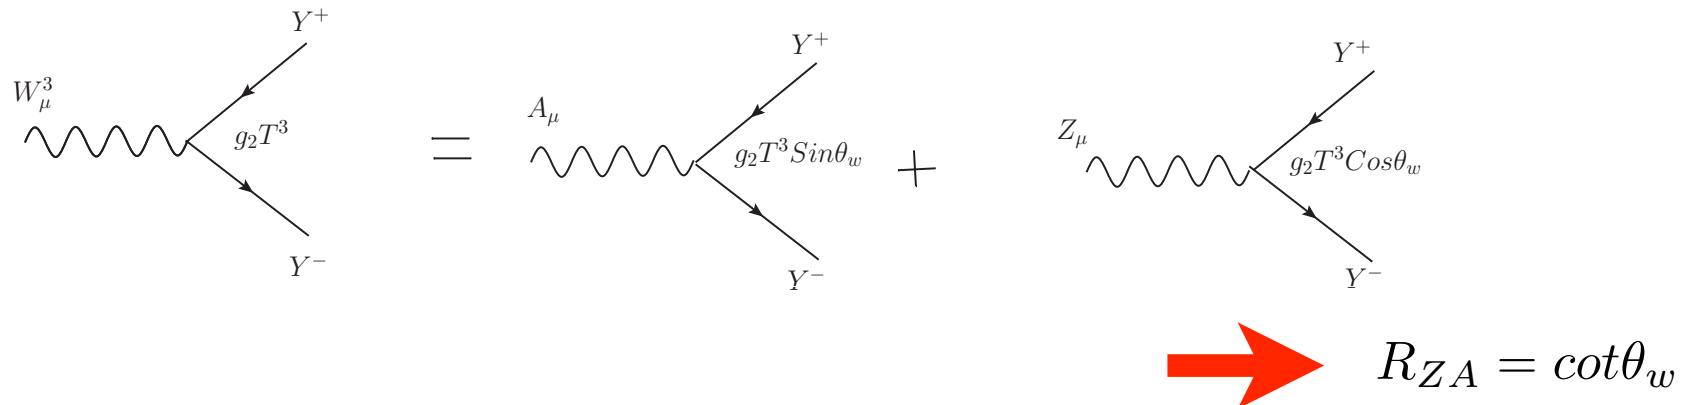

- Singlet

- Doublet

● Triplet

$$\sin\theta_w = 0.231$$

$I_{\text{SU}(2)}$	R_{ZA}
1	$-\tan\theta_W \approx -0.548$
2	$\cot(2\theta_W) \approx 0.638$
3	$\cot\theta_W \approx 1.824$

Coupling determination

- The relative sign of $A_{l^- l^+}$ is connected to the sign of the ratio R_{ZA} and the sign of the γ_5 term in the $XY\ell$ coupling.

2	$\cot(2\theta_W) \approx 0.638$
3	$\cot \theta_W \approx 1.824$

Numerical results for coupling determination

		model A					
		4	5	6	7	8	9
model B	5	36					
	6	4.9	29				
	7	1.6	33	2.9			
	8	32	3.5	26	29		
	9	6.7	27	1.5	4.7	23	
	10	0.3	37	5.8	2.2	33	7.6

- Statistical significance, in units of standard deviations.
- 5000 parton-level events without cut and detector effects.
- The differential asymmetry $dA_{\ell^+\ell^-}/d \tanh(\Delta\eta_{\ell\ell}/2)$ is used.

Conclusions

- New physics processes with missing energy in the final state are challenging to analyze at the LHC since they offer only few kinematical handles.
- Two new variables for spin determination and one new variables for coupling determination are introduced.
- $s_Y = 0$: It is generally not possible to discriminate between cases with different couplings.
- $s_Y = 1/2$, only some pairs cannot achieve a 3 sigma discrimination with a realistic number of a few thousand events.
- Fast detector simulation with selection cuts are performed and we found our conclusion still hold.

Thank you.
